

# AI-driven product

path from research to production

# Ihar Nestsiaenia

Tech Lead, involved in AI projects last 3 years.

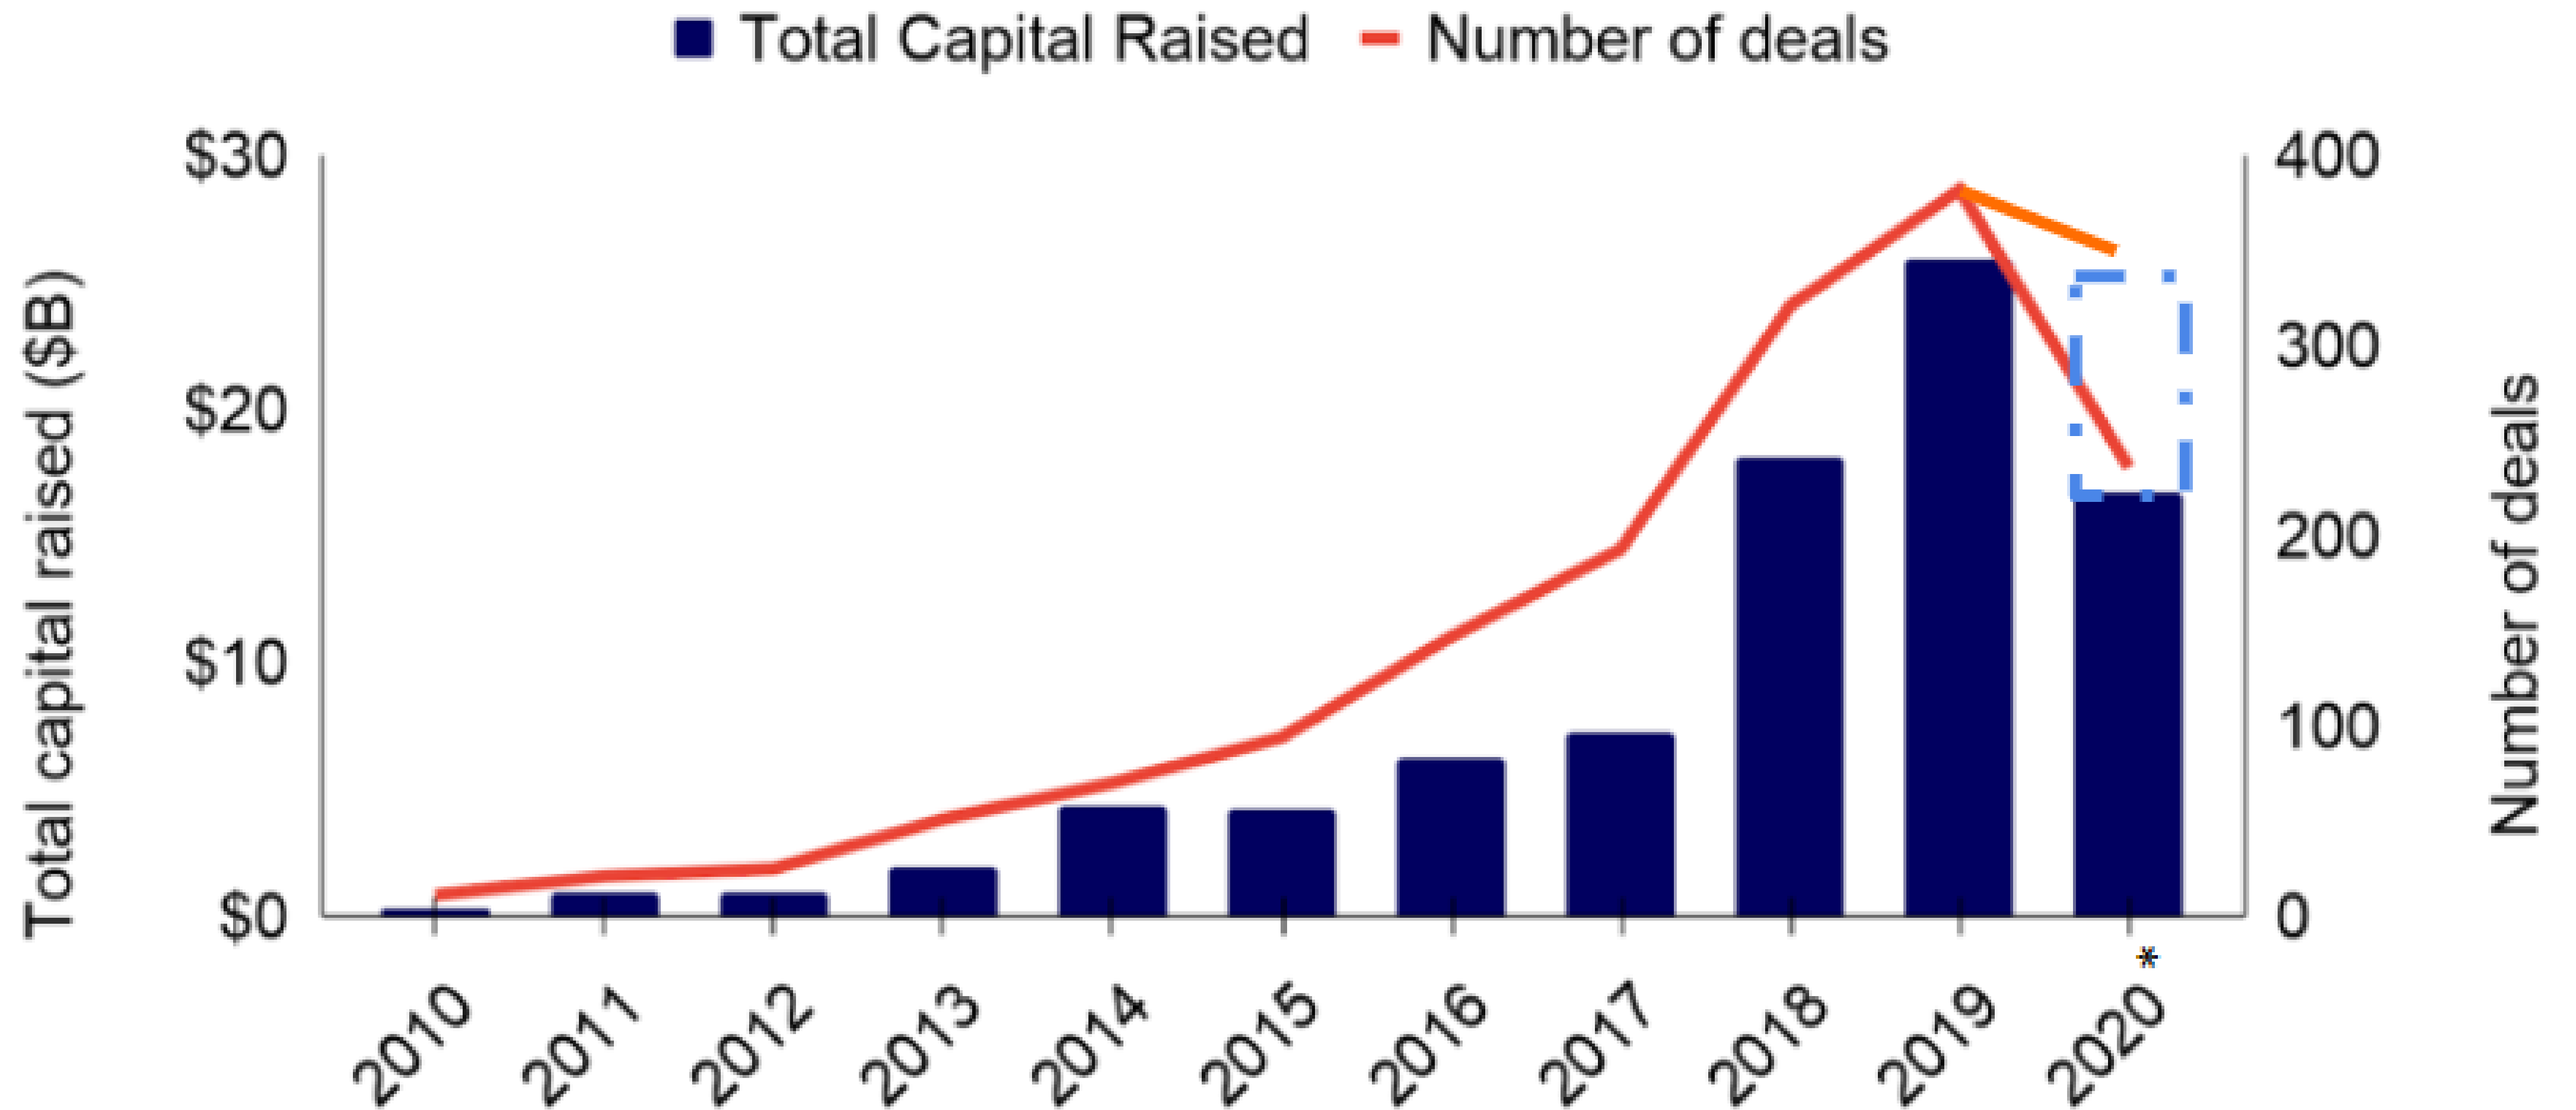

Mostly I'm working with NLP projects:

- Question answering systems
- Text classifiers
- Semantic Search
- Entity Extraction

# : AI industry is growing

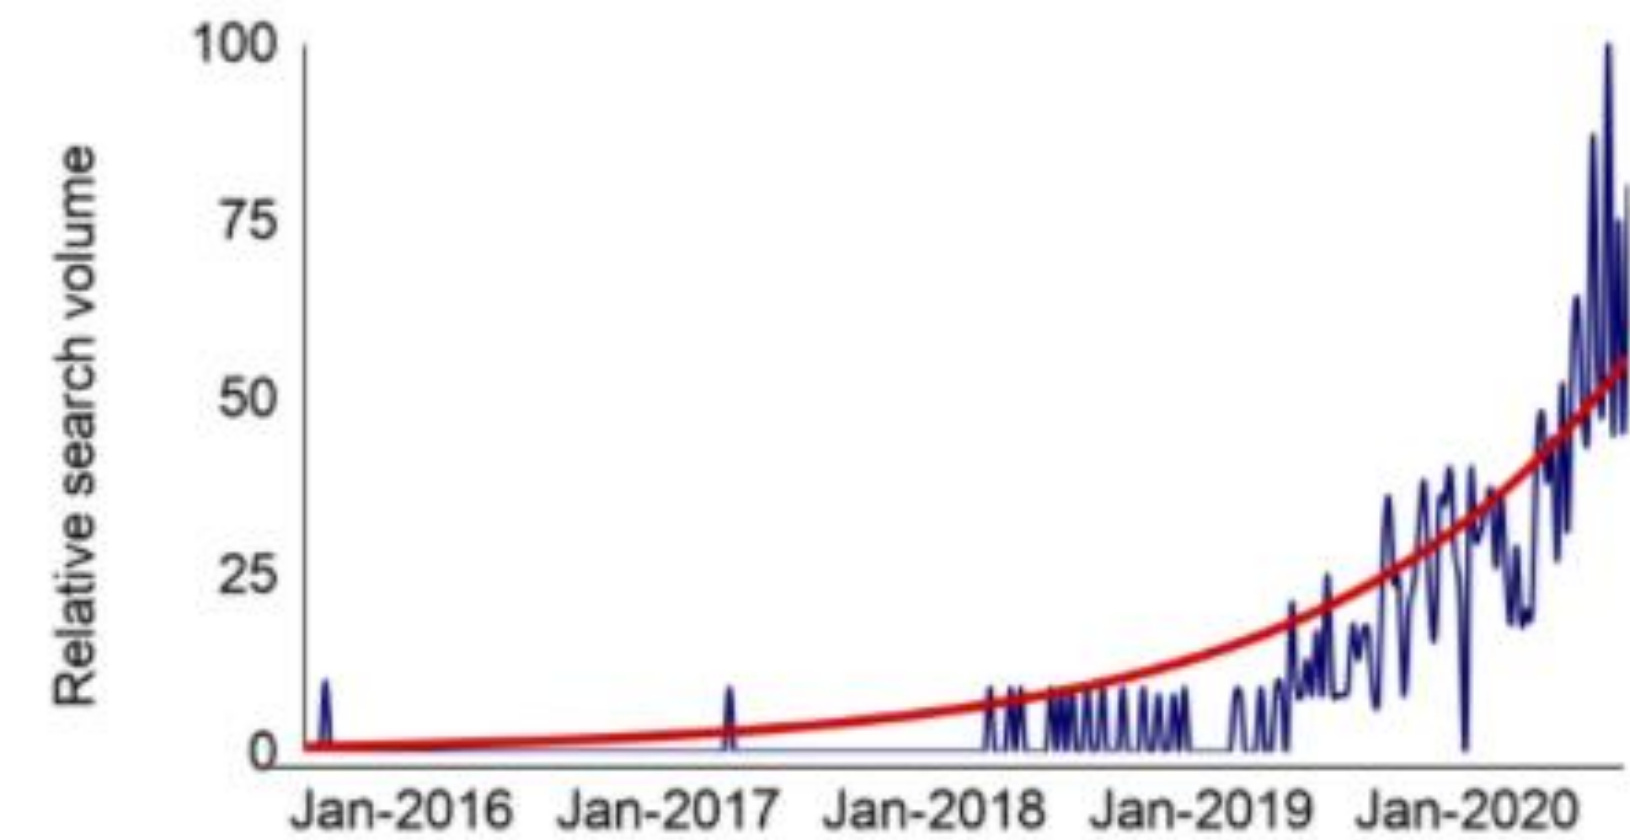

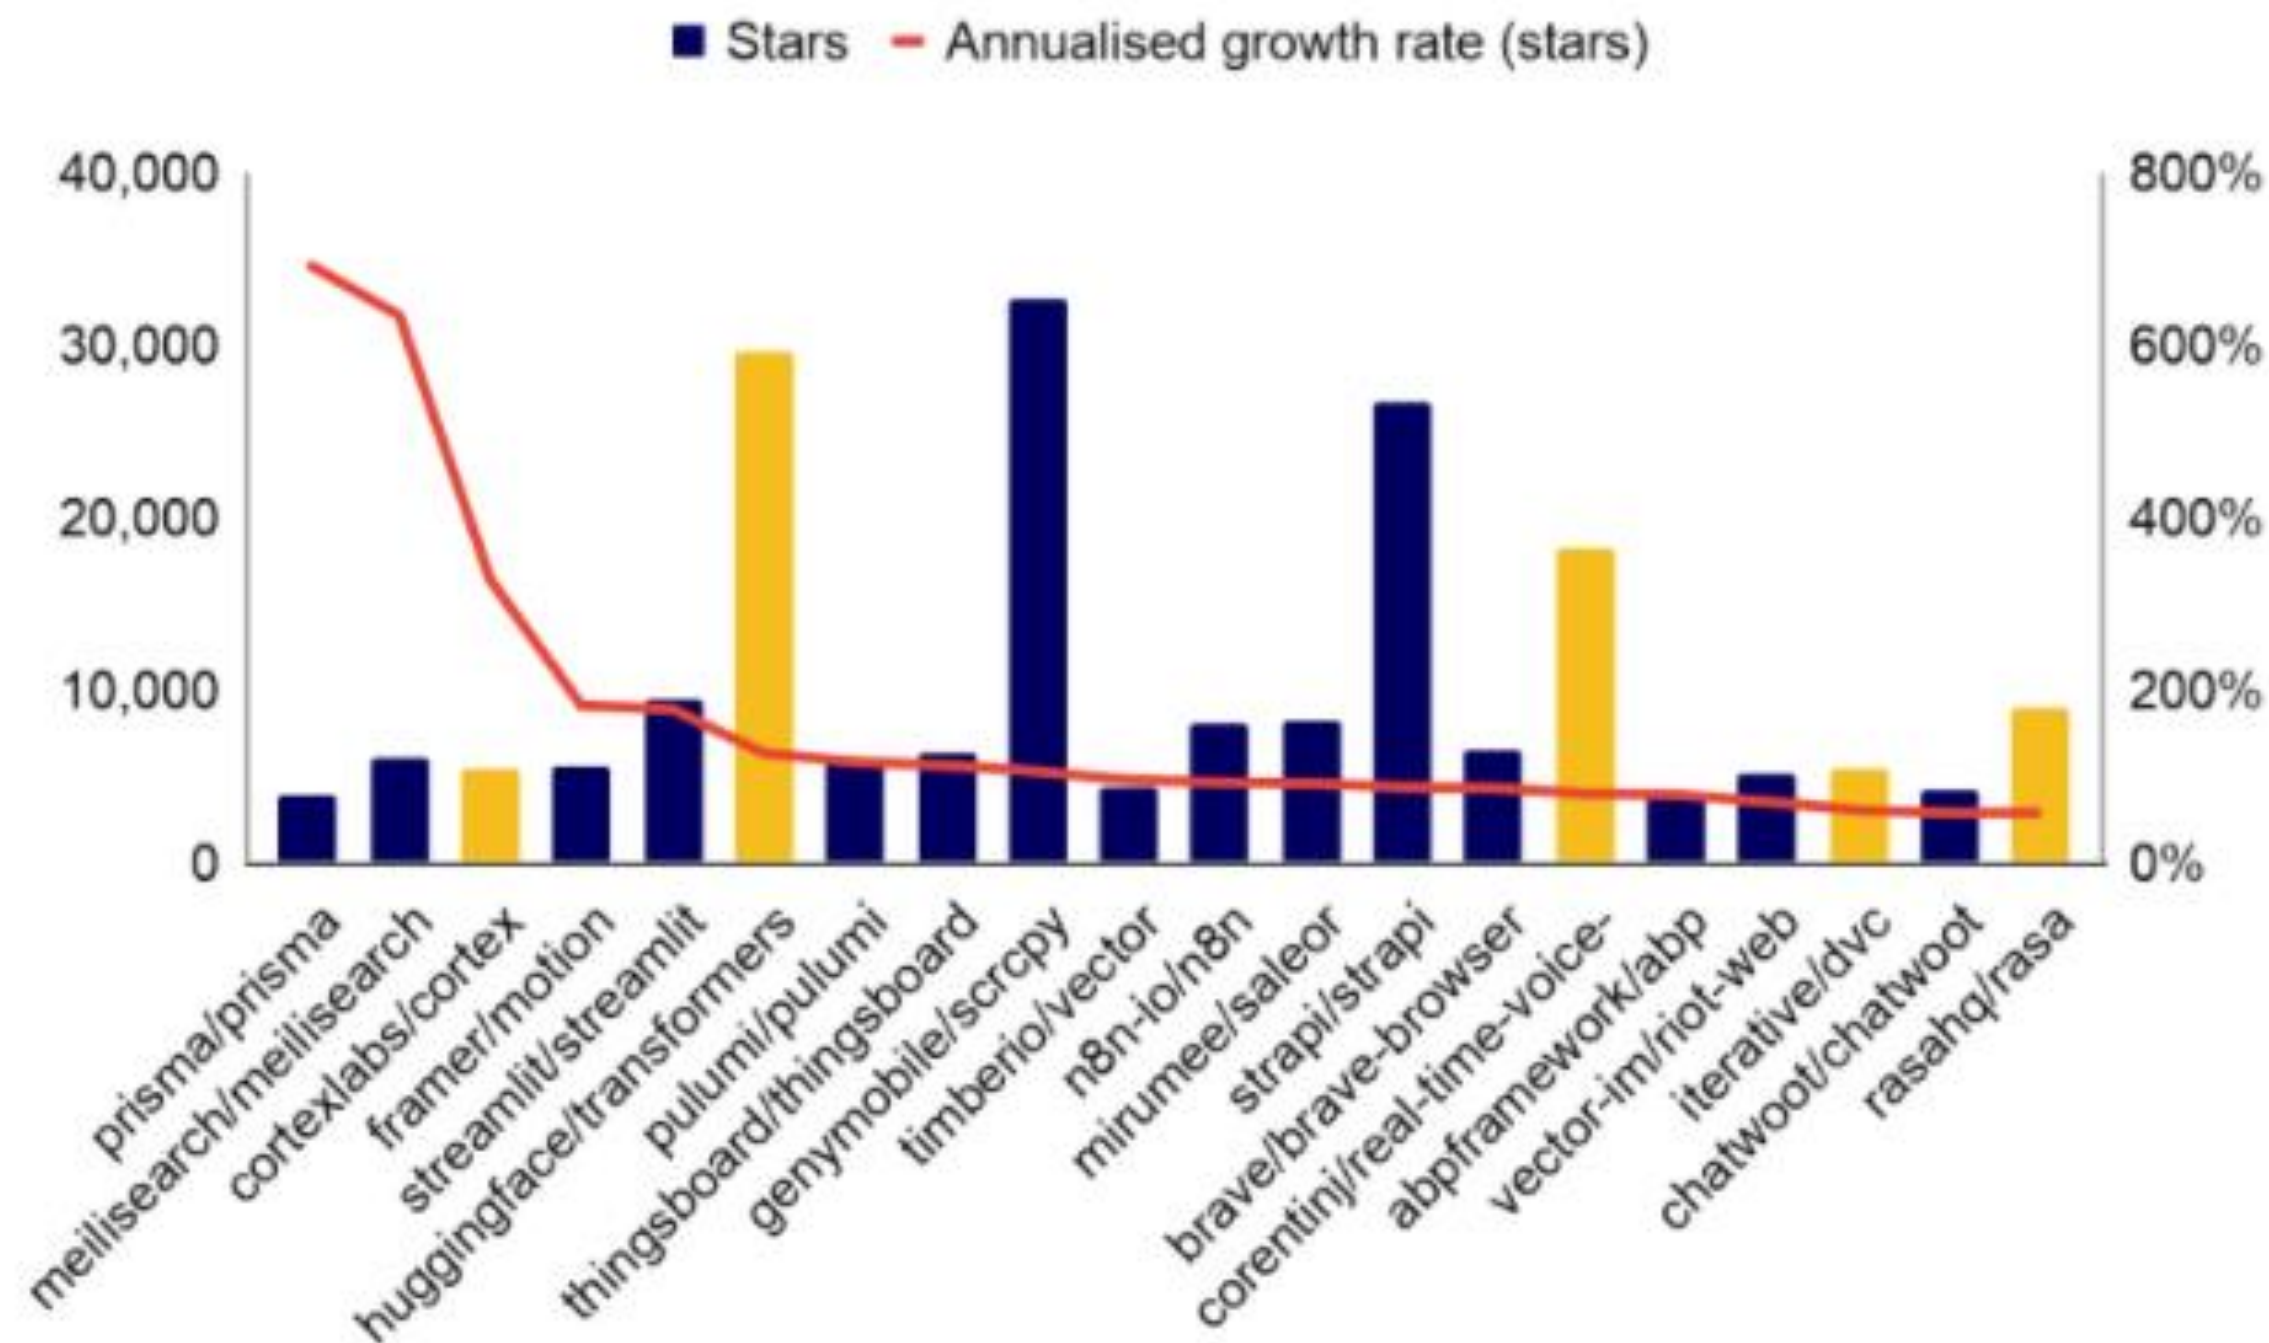

IT Home

# What does it mean for engineers

The rise of MLOps (DevOps for ML) signals an industry shift from technology R&D (how to build models) to operations (how to run models)

25% of the top-20 fastest growing GitHub projects in Q2 2020 concern ML infrastructure, tooling and operations. Google Search traffic for “MLOps” is now on uptick for the first time.

# : How much time is needed for deployment

IT Home

**36%** of survey participants said their data scientists spend **a quarter** of their time deploying ML models

**36%** of survey participants said their data scientists spend **a quarter to half** of their time deploying ML models

**20%** of survey participants said their data scientists spend **half to three-quarters** of their time deploying ML models

**7%** of survey participants said their data scientists spend **more than three-quarters** of their time deploying ML models

Why is delivery of AI such a difficult task?

# Challenges of AI projects

- Good metrics but **poor product**
- Infinite experiments but **no delivery**
- **Reproducibility** of experiments
- Data, artifacts, code and metrics mess
- **Time to introduce new** ML engineer in a team

# : Trivial example — Sentiment classification

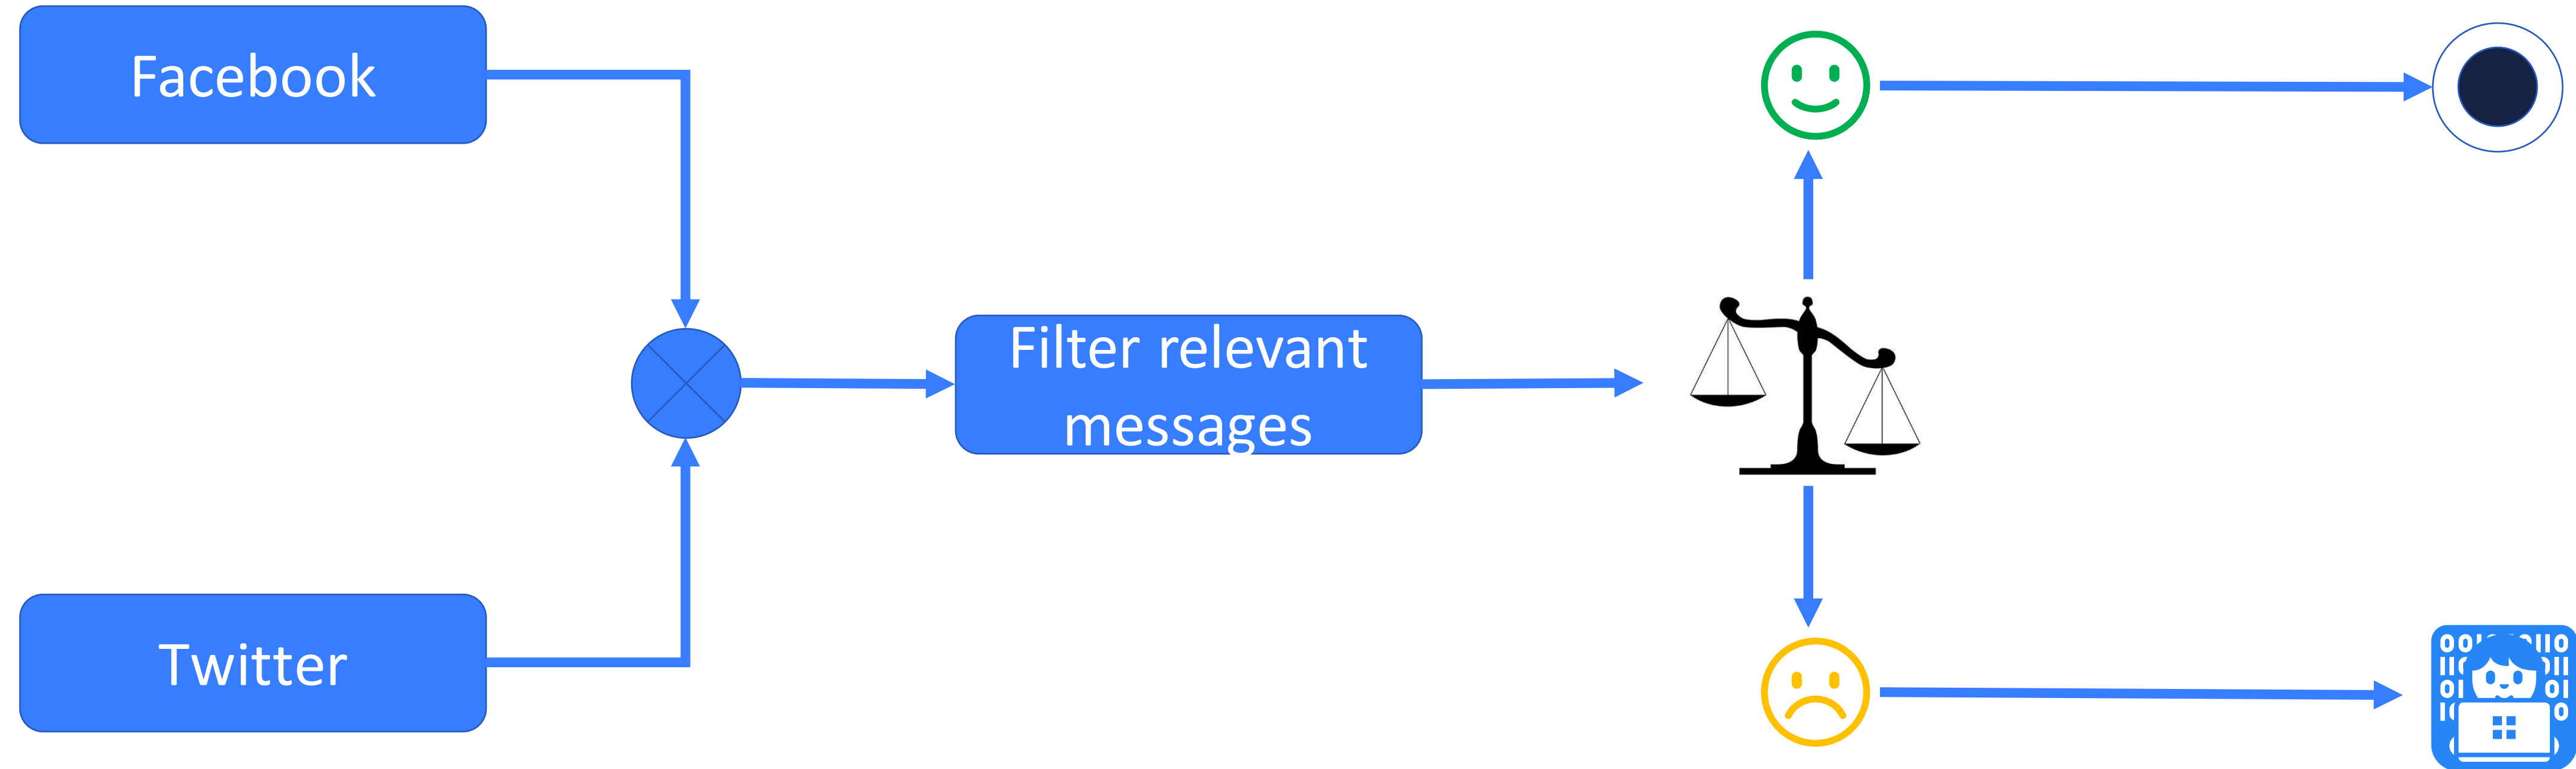

"Containers Fundamentals" training from  
[@CloudNativeFdn](#) will teach you how to do container  
and image operations w/ different runtimes, manage  
network and storage w/ [#containers](#), build and run  
multi-container applications with [#Docker](#) & more:  
[bit.ly/33IAMyl](#) [#learnlinux](#)

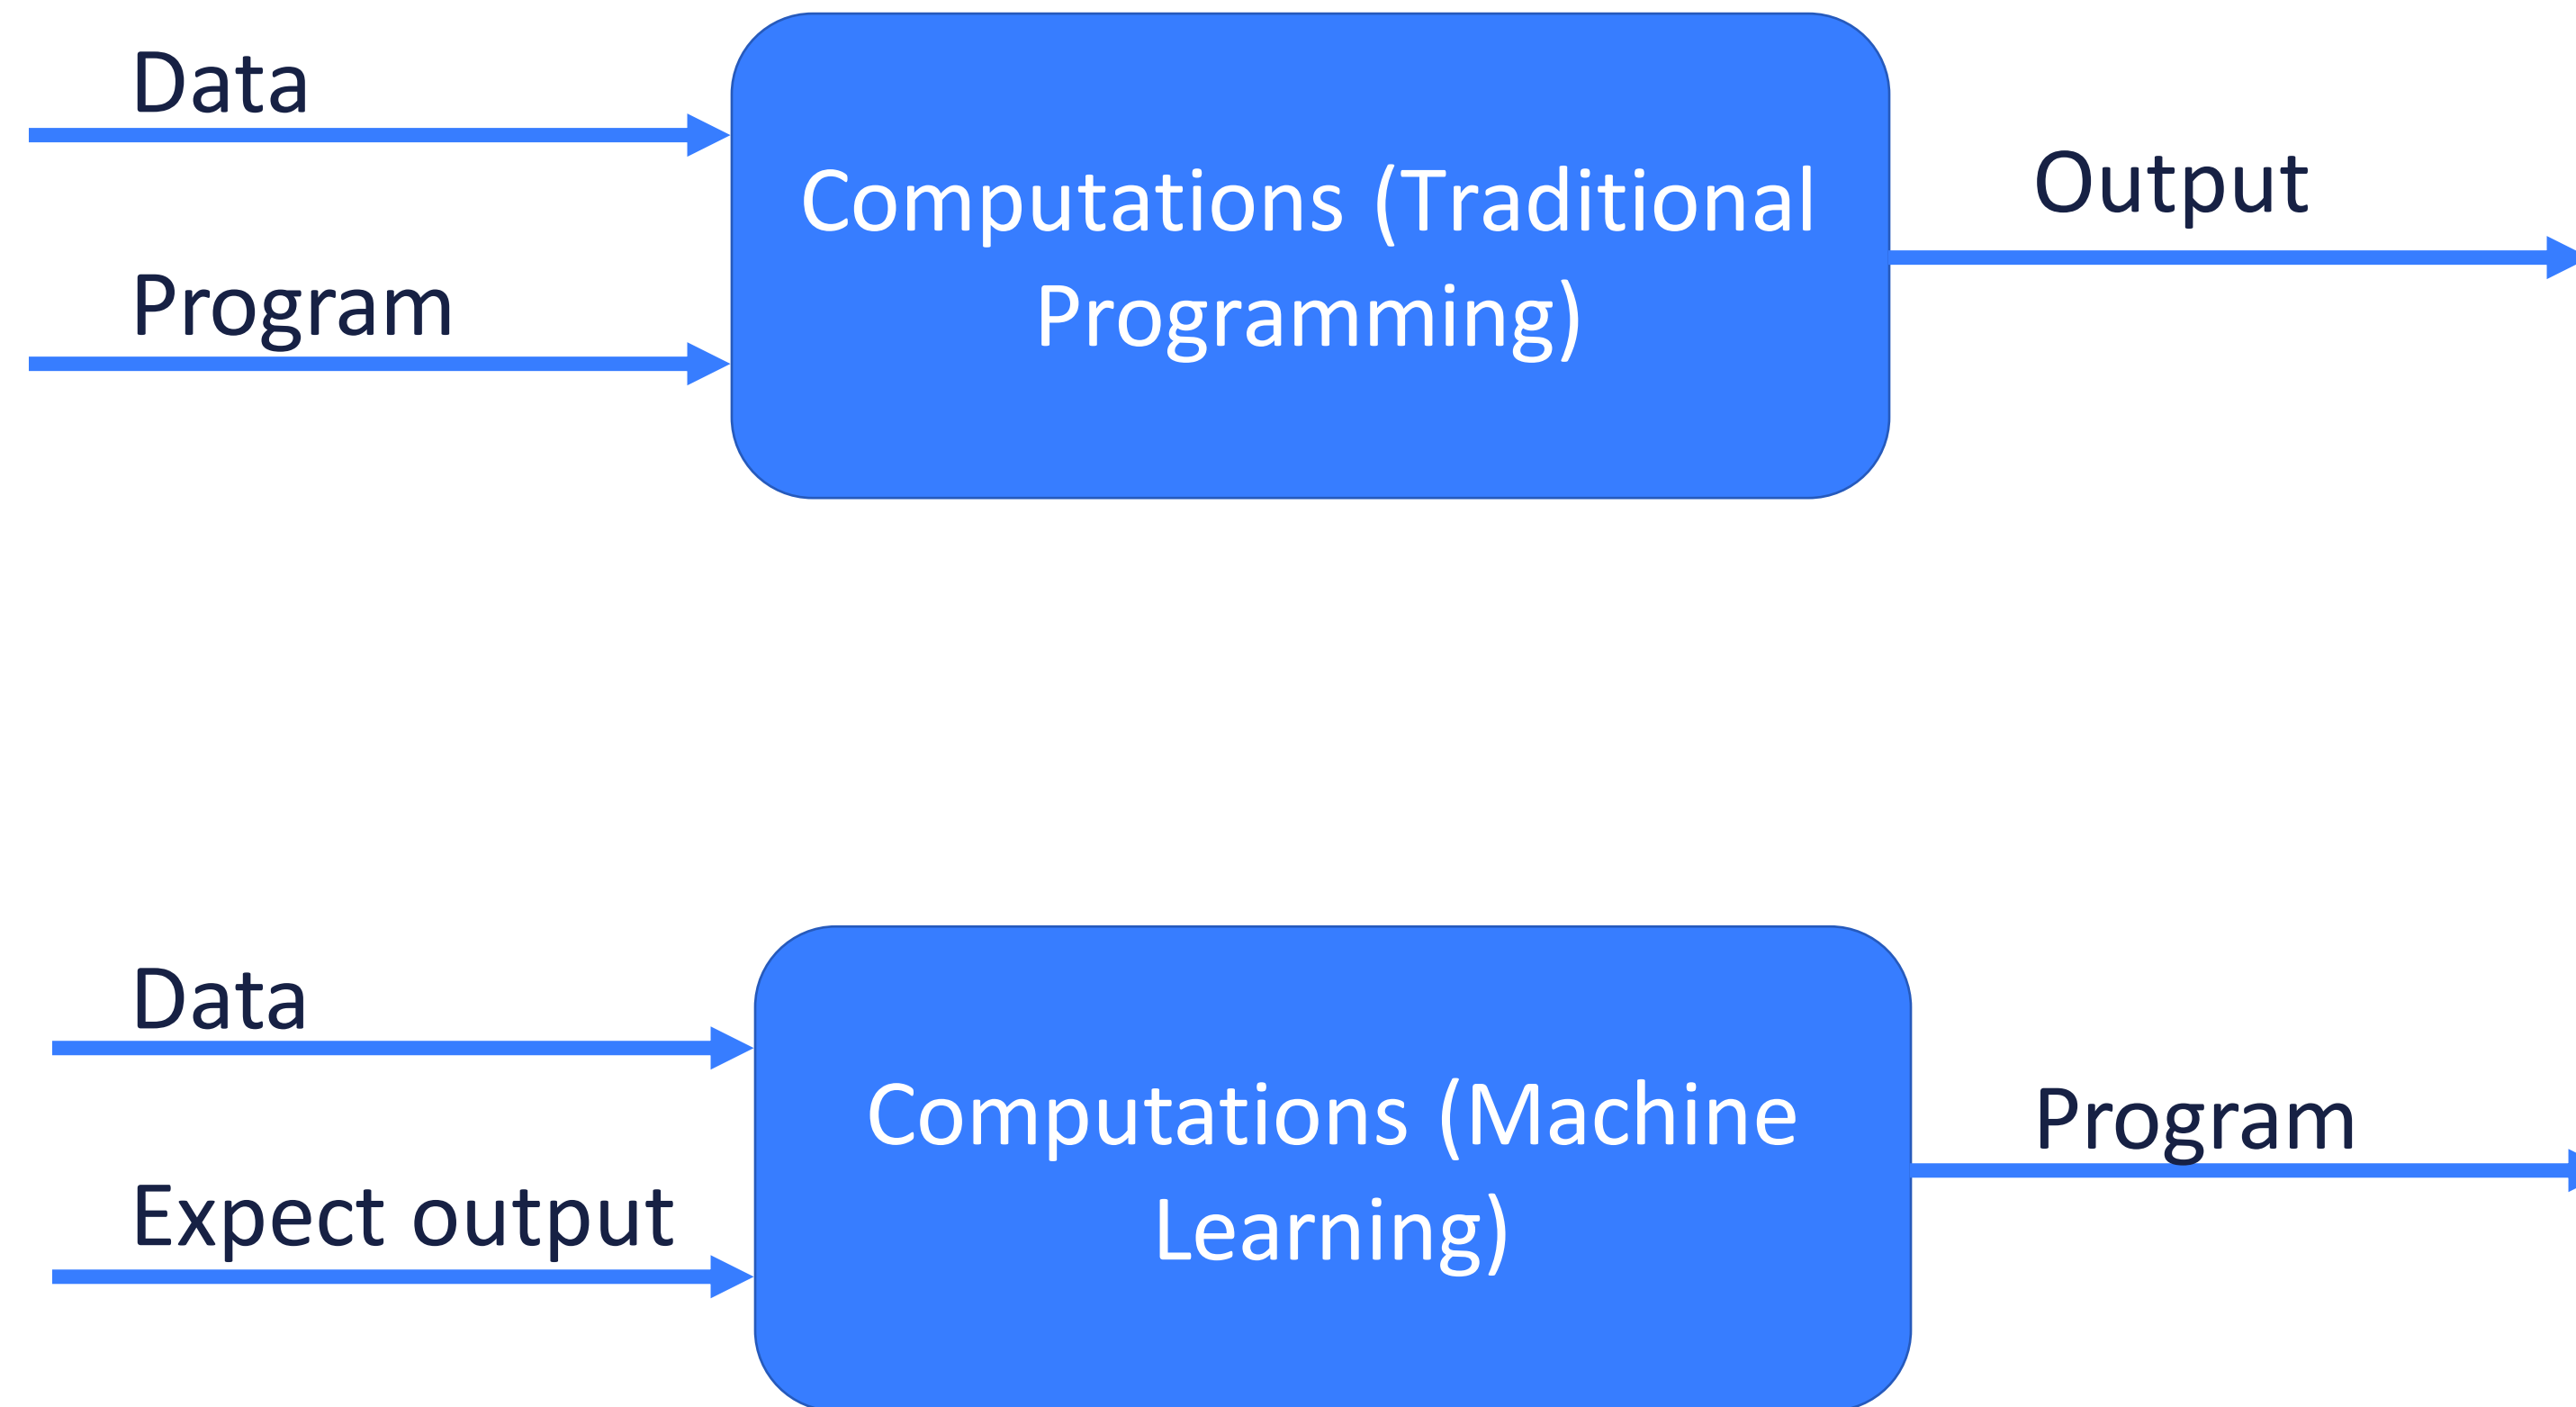

## : Trivial example — Business Objective

IT Home

Use this business objective to define metrics and recognize “**what good is good enough**”

# : Data First — Machine Learning in Nutshell

## : Trivial example — Data annotation

# : Trivial example — Experiments

IT Home

# : Trivial example — Operationalization

# : Trivial example — Delivery

# : Trivial example

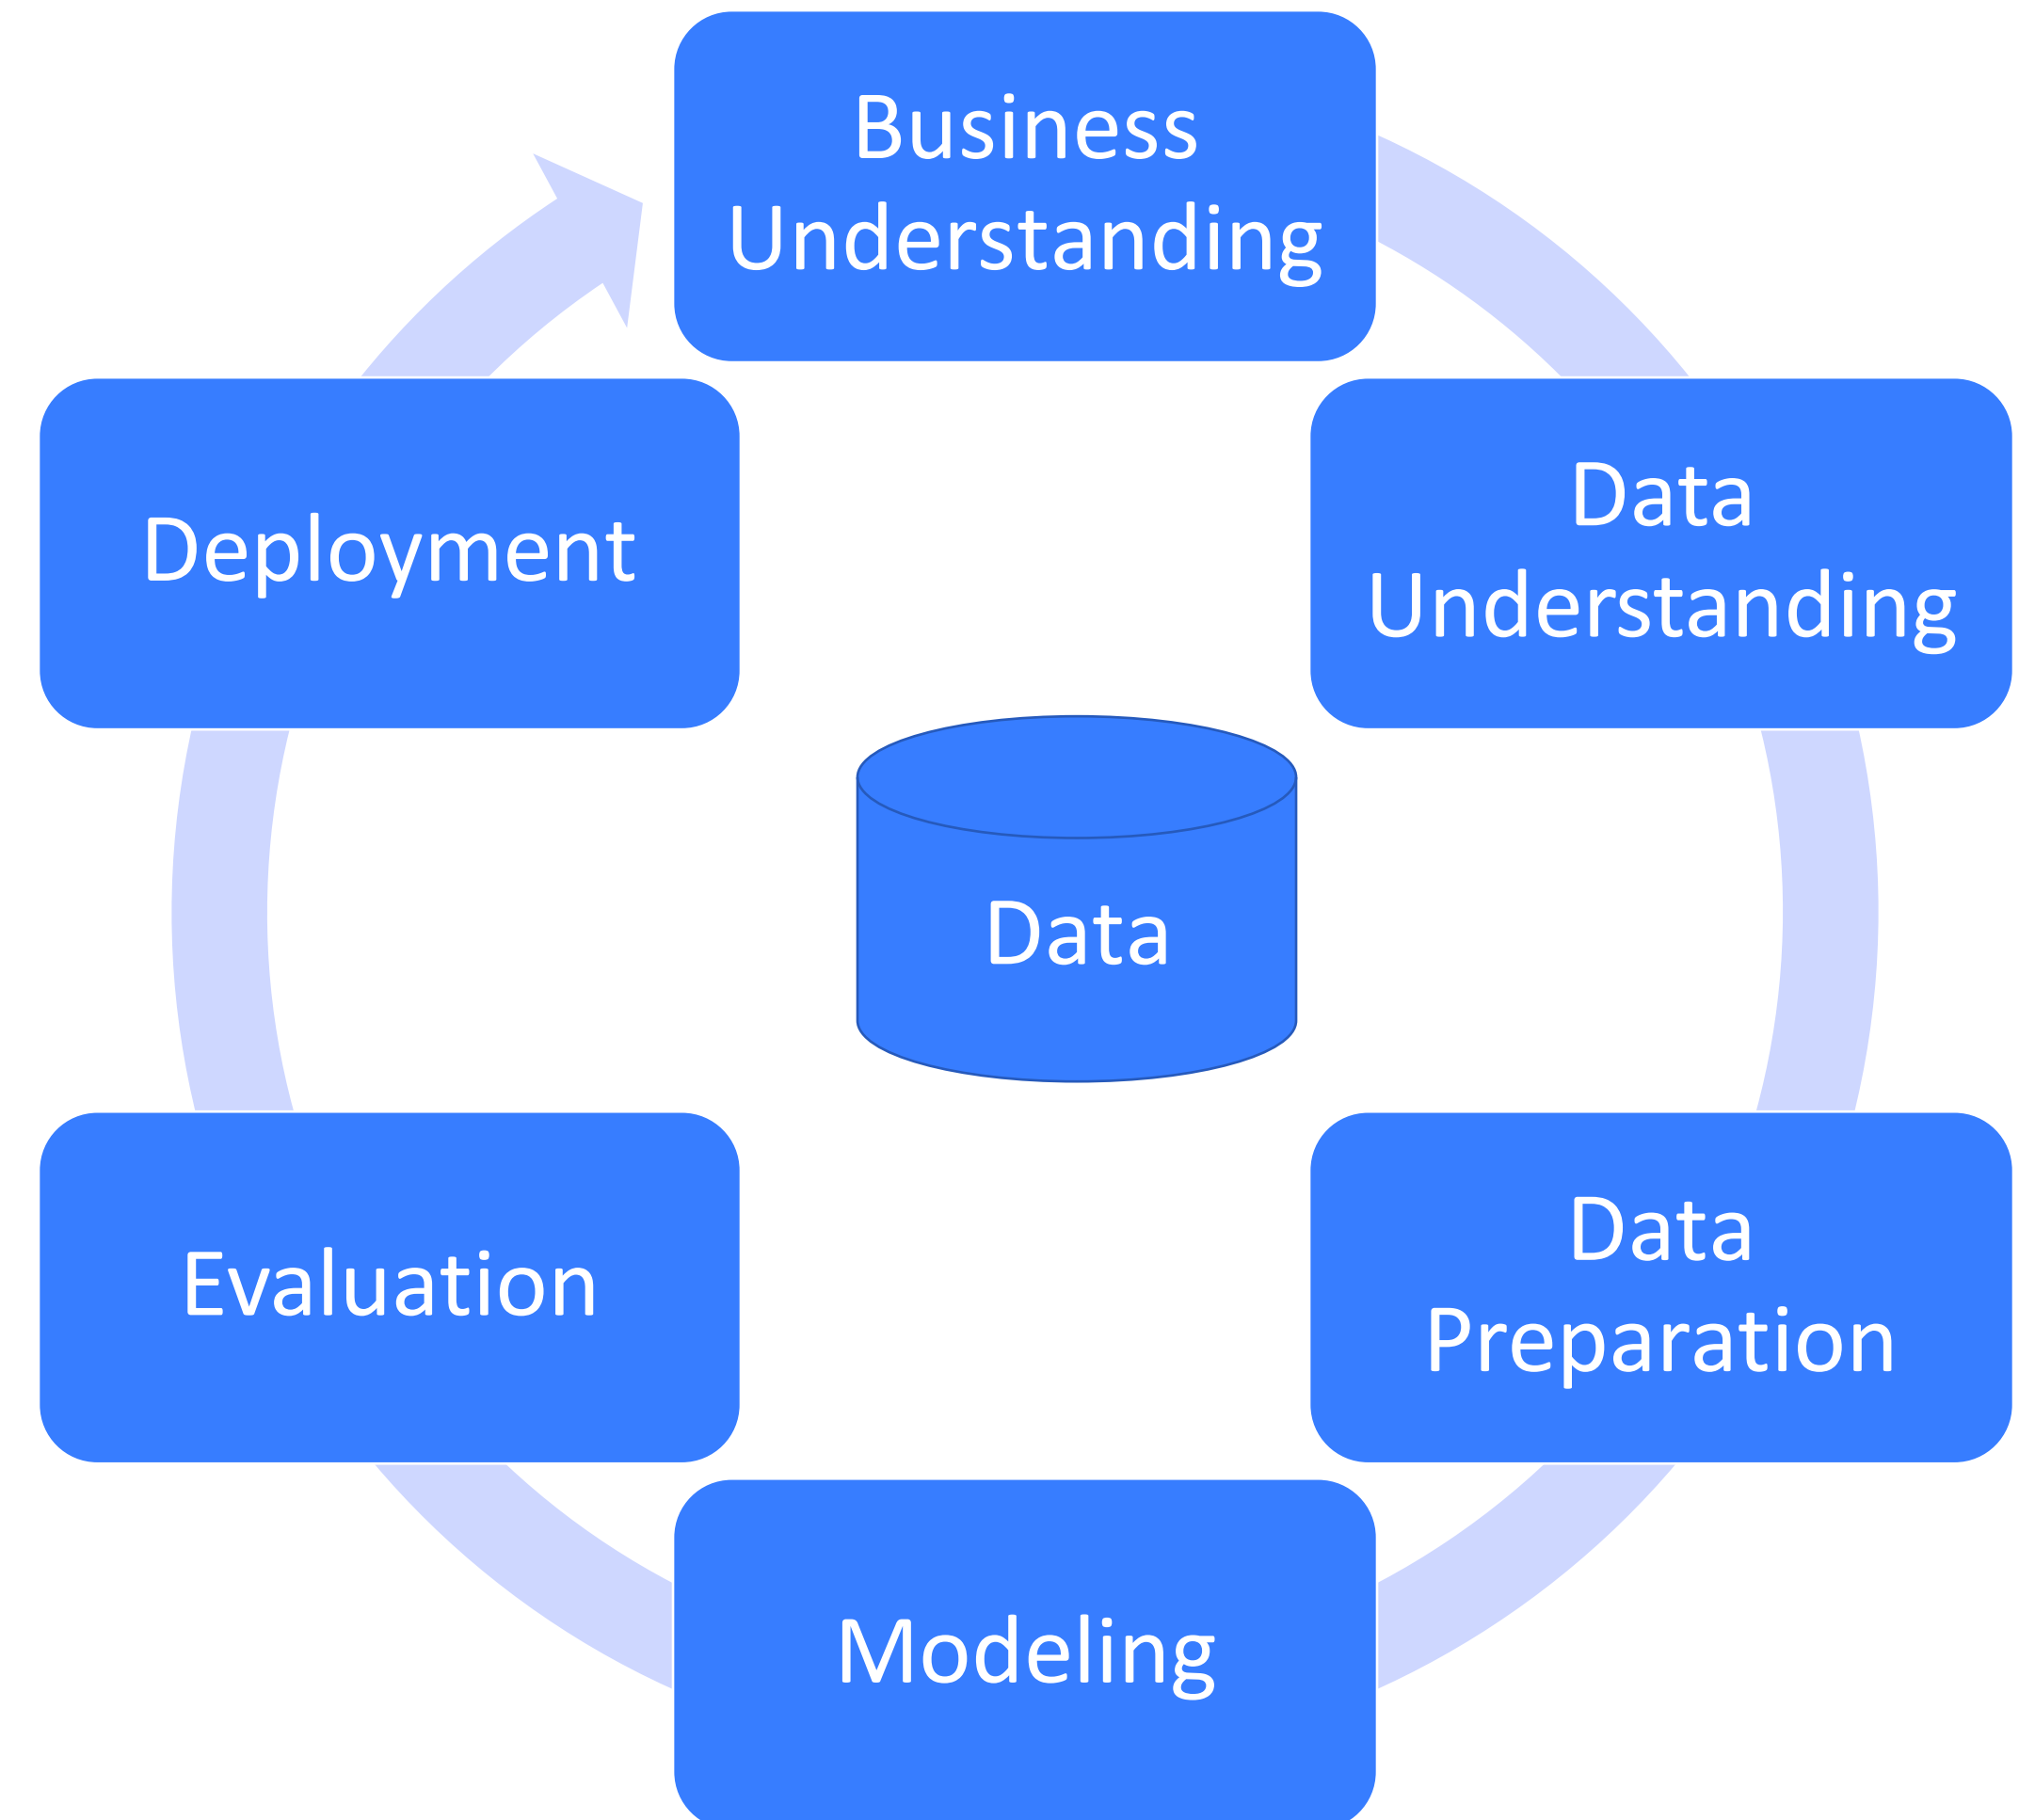

Expectation

Reality

Developing of ML project is **iterative process** with many steps back and forward with artifact on each step.

COLLECT AND  
ANNOTATE DATA

DATA QUALITY

# : Definition of Business Objectives

<div>Decisions</div> <div>How are predictions used to make decisions that provide the proposed value to the end-user?</div> <div></div>	<div>ML task</div> <div>Input, output to predict, type of problem.</div> <div></div>	<div>Value Propositions</div> <div>What are we trying to do for the end-user(s) of the predictive system? What objectives are we serving?</div> <div></div>	<div>Data Sources</div> <div>Which raw data sources can we use (internal and external)?</div> <div></div>	<div>Collecting Data</div> <div>How do we get new data to learn from (inputs and outputs)?</div> <div></div>
<div>Making Predictions</div> <div>When do we make predictions on new inputs? How long do we have to featurize a new input and make a prediction?</div> <div></div>	<div>Offline Evaluation</div> <div>Methods and metrics to evaluate the system before deployment.</div> <div></div>		<div>Features</div> <div>Input representations extracted from raw data sources.</div> <div></div>	<div>Building Models</div> <div>When do we create/update models with new training data? How long do we have to featurize training inputs and create a model?</div> <div></div>
<div>Live Evaluation and Monitoring</div> <div>Methods and metrics to evaluate the system after deployment, and to quantify value creation.</div> <div></div>				

∴ How costly are wrong predictions?

# Data Annotation

- Create Guides
- Validate labels with ML team
- Cross-validate labels

Car<sup>[2]</sup>

# Data Annotation

- Label studio (<https://labelstud.io>)
- Sagemaker Ground truth
- Check github awesome-data-labeling

Car<sup>[2]</sup>

USE THE  
CRS DATA—  
BASE TO  
SIZE THE  
MARKET.

THAT  
DATA IS  
WRONG.

THEN  
USE THE  
SIBS  
DATA—  
BASE.

THAT  
DATA IS  
ALSO  
WRONG.

CAN YOU  
AVERAGE  
THEM?

SURE. I CAN  
MULTIPLY  
THEM TOO.

Garbage in – Garbage out!

# : Summary

- Think about problem, not a metric
- Select metric connected with business goal
- Define how good is good enough
- No Data — No AI

INTEGRATION

MODEL SERVING

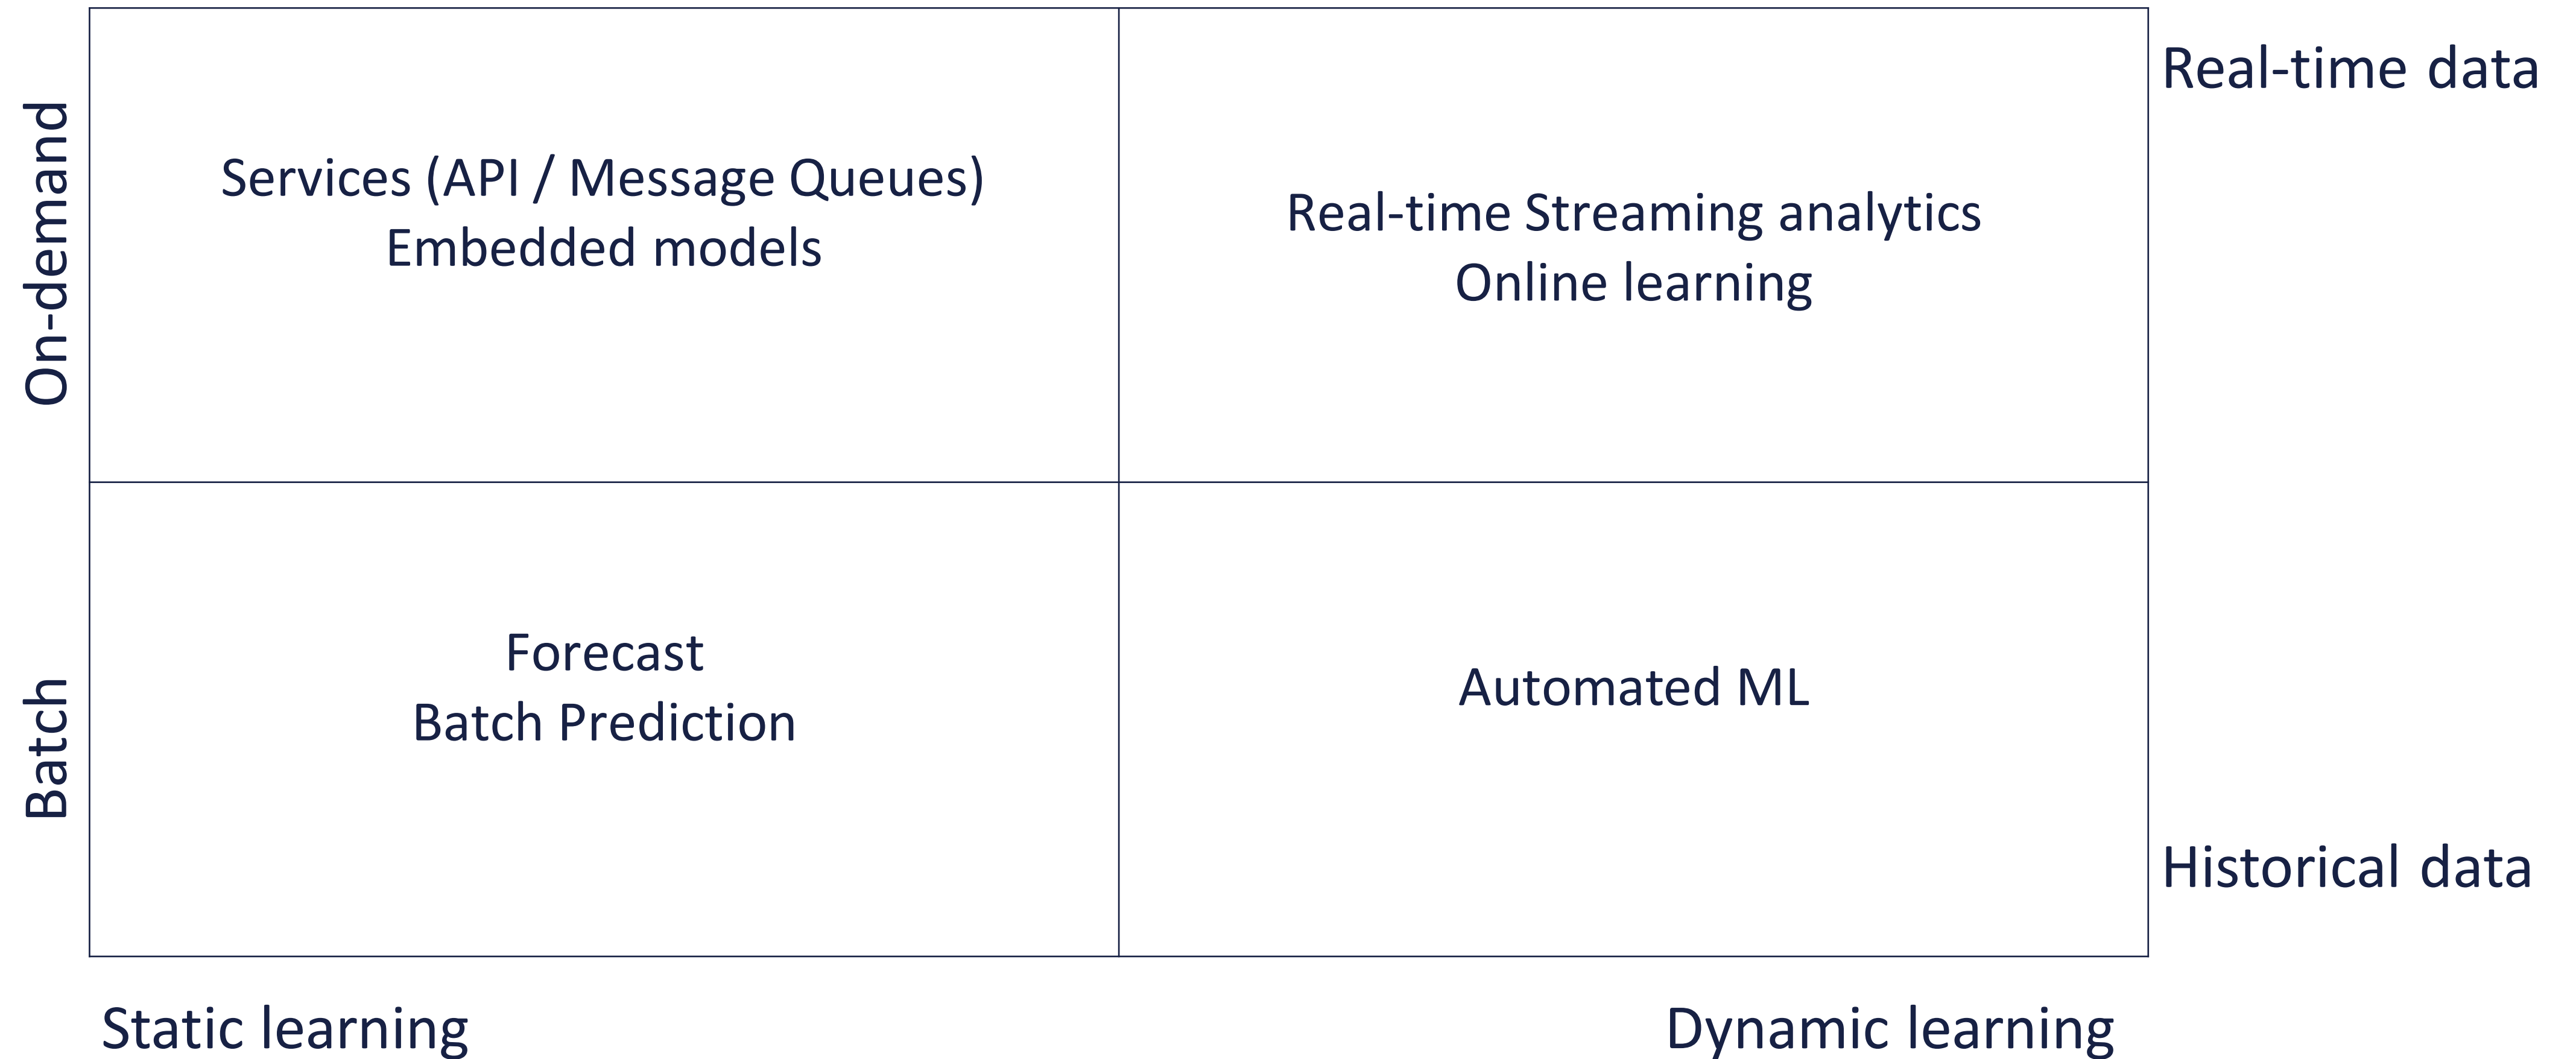

CI/CD PIPELINES

MONITORING AND  
FEEDBACKS

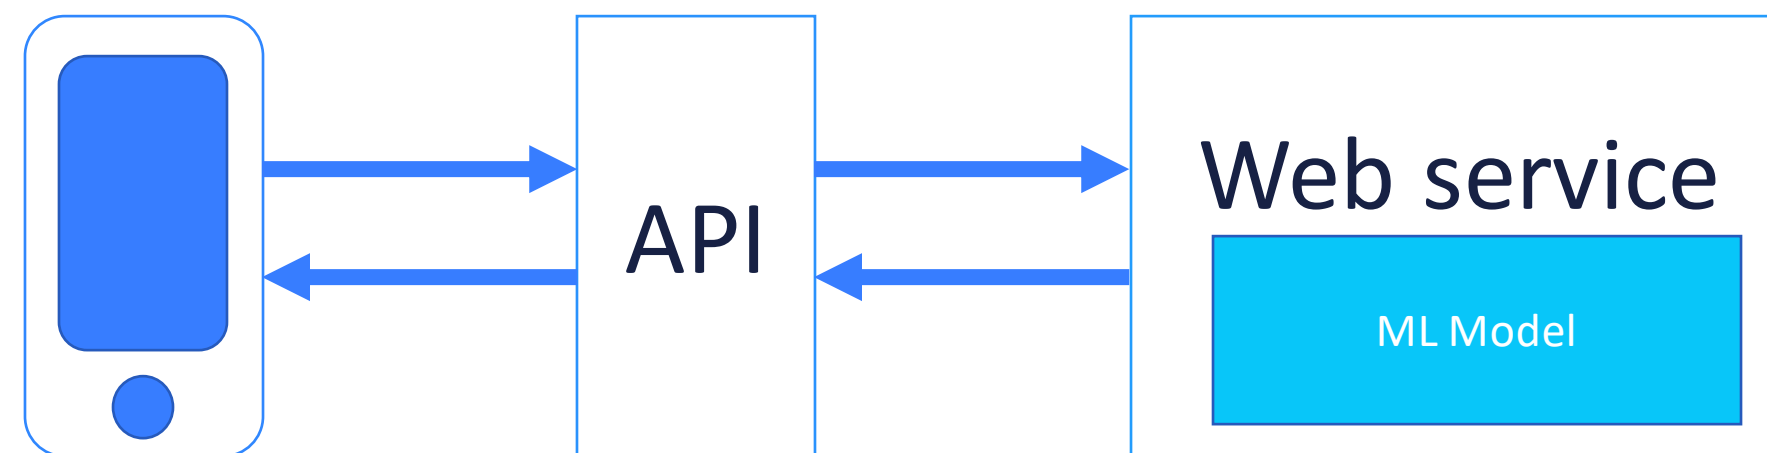

# : Model Integration Patterns

# : Model Serving Patterns

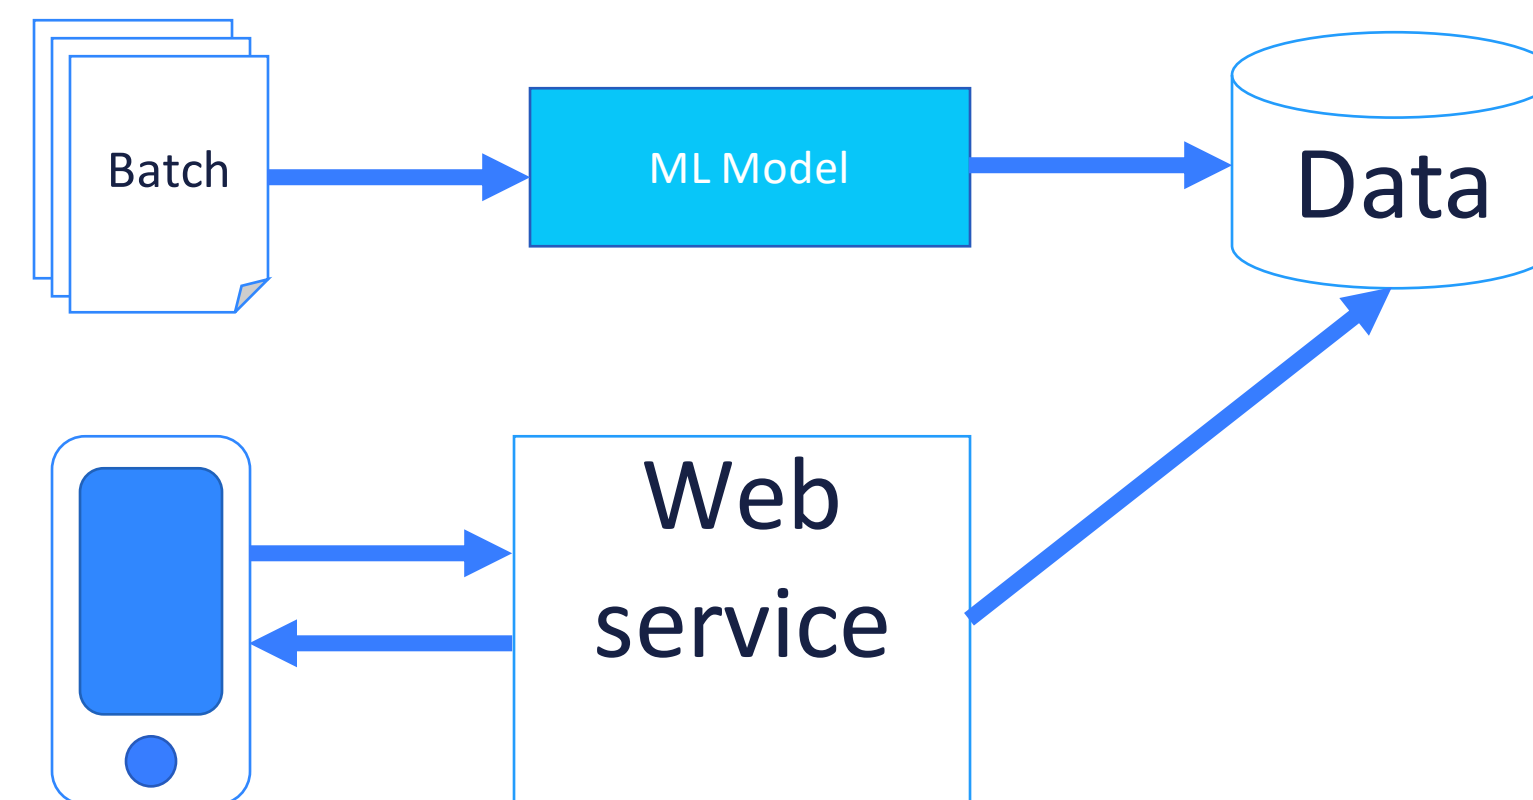

Model-as-Service

Model-as-Dependency

Precompute

# : Continuous X

**Continuous Integration (CI)** extends the testing and validating code and components by adding testing and validating data and models.

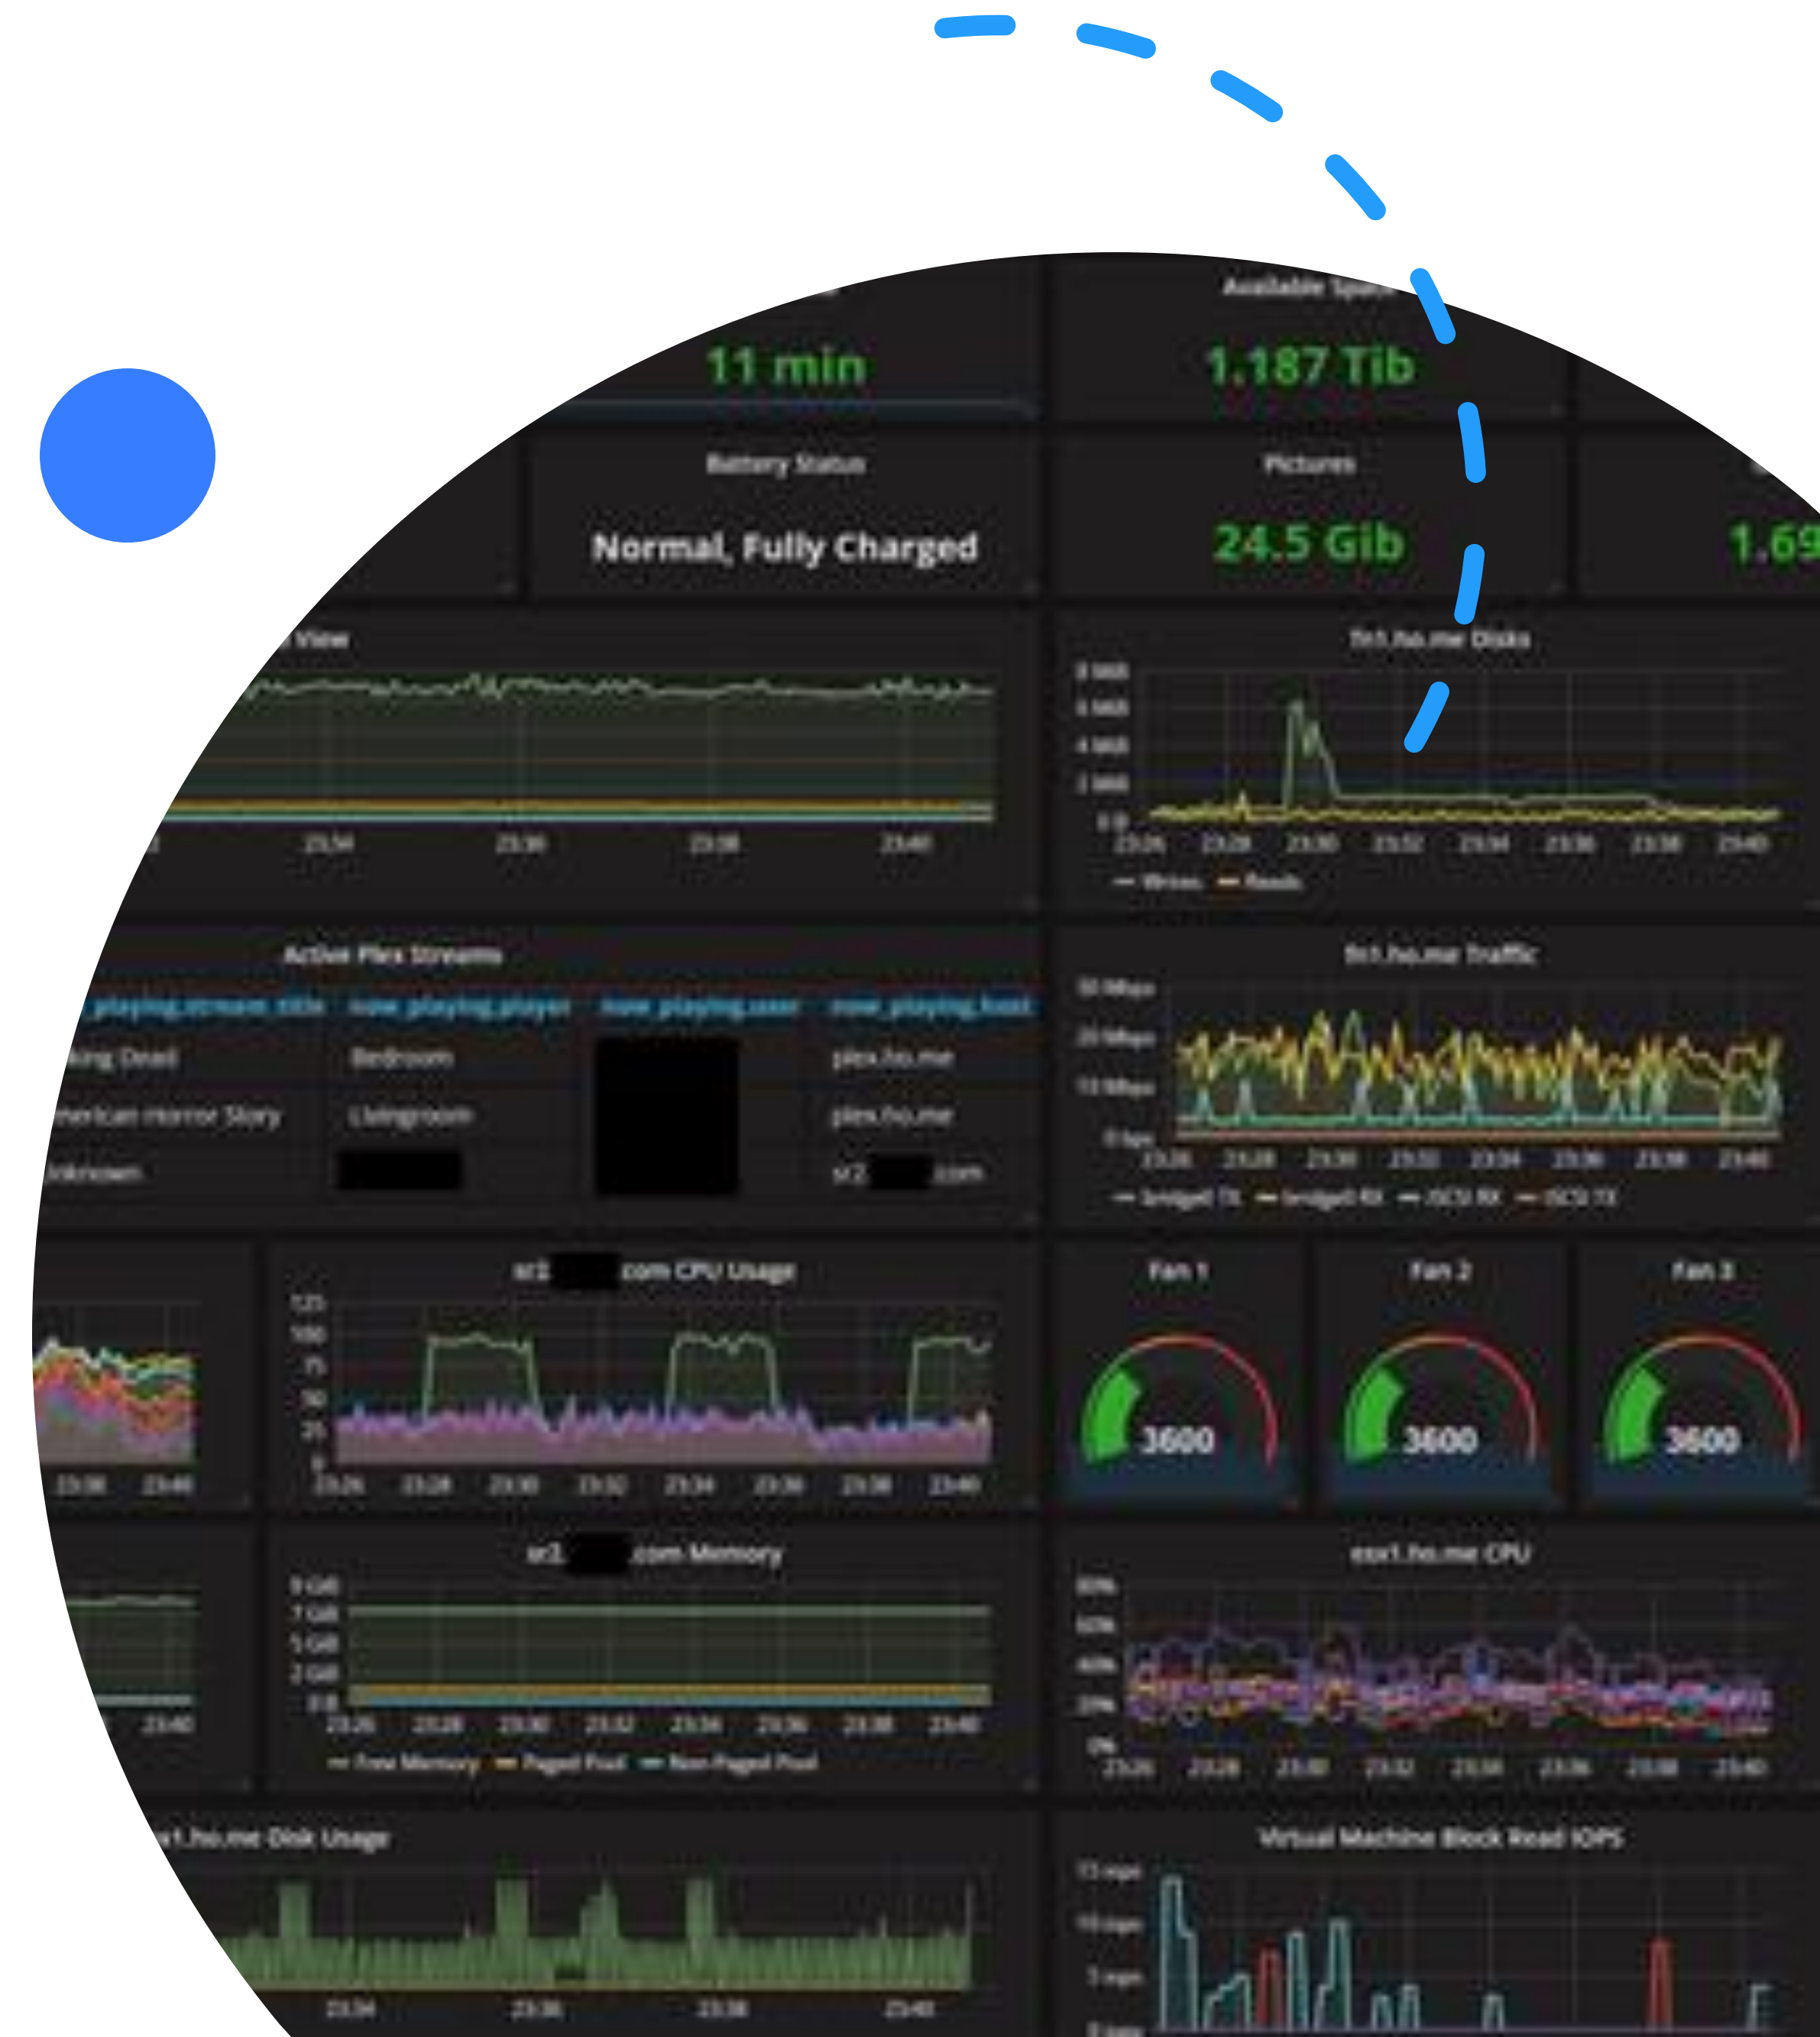

**Continuous Delivery (CD)** concerns with delivery of an ML training pipeline that automatically deploys another the ML model prediction service.

**Continuous Training (CT)** is unique to ML systems property, which automatically retrains ML models for re-deployment.

**Continuous Monitoring (CM)** concerns with monitoring production data and model performance metrics, which are bound to business metrics.

# What to monitor?

- Data distribution
- Measure production predictions
  - Detect model degradations
- Feedback
  - Insights from user, which can help measure or improve model

# : Summary

- Select integration pattern depending on model use-cases
- Monitor data
- Collect feedback

# Take always

Wrongly defined problem most popular cause of ML project fail

Delivery of ML usually takes more then half of time of ML team

Good machine learning skills is not enough for successful product delivery
